

Acme Cloud - Administrator & Security Guide

This guide is for workspace administrators. It explains user roles, authentication, access control, and audit logging.

User roles

Acme Cloud has three roles: Member (can read and edit files they have access to), Manager (can manage a workspace and its members), and Admin (can manage the whole organization, billing, and security settings).

Enforcing two-factor authentication

1. Open Admin Settings and select Security.
2. Turn on 'Require two-factor authentication (2FA)' for all members.
3. Members will be prompted to enrol an authenticator app on next sign-in.
4. You can reset a member's 2FA from the Members page if they lose their device.

Configuring single sign-on

Acme Cloud supports SAML and OIDC single sign-on. In Admin Settings > SSO, enter your identity provider's metadata URL, map the email and name attributes, and assign a default role for newly provisioned users.

Access control lists

Every file and folder has an access control list (ACL) that grants permissions to users or groups. Permissions inherit from the parent folder unless you override them. Use groups rather than individual users to keep ACLs maintainable.

API keys and webhooks

Generate an API key under Settings > Developer to call the Acme Cloud API. Keep API keys secret and rotate them periodically. Configure a webhook to receive a callback when files are created, updated, or deleted.

Audit log and data retention

The audit log records sign-ins, permission changes, and file activity. Set a data retention policy to automatically delete files in the trash after a fixed number of days, or to retain audit records for compliance.
